APPLICATION

- ◆ Potatoes
- ◆ Carrots
- ◆ Leek
- ◆ Other crops

HARVEST ADVANCING FILM

suitable for frost protection

provides harvest advancing

strong grades

By deploying HARVEST ADVANCING FILM, you create an ideal climate under the foil. The foil causes the temperature under the foil to rise compared to the ambient temperature. This also ensures that the temperature in the ground does not drop as fast, the humidity will increase as a result. On this basis, it is possible to get an early harvest of your crop by allowing the crop to grow faster. The film has strong grade, making it ideal for use over the crop and attaching it to the side of the bedding.
